

TECHNICAL SKILLS

Programming Languages/Frameworks/Libraries/Design Software

- Languages/Frameworks: Python, C++, JavaScript, React.js, Next.js, HTML, CSS, Ruby, FastAPI
- Cloud/DevOps: AWS (RDS, Elastic Beanstalk, ECR), Docker, Git, Cloudflare, Celery, Redis
- Other: Git, Framer Motion

EXPERIENCE

TranQuility Inc.

Toronto, ON

Software Engineer — Full Stack Development

May 2025 - August 2025

- Built the core of the EncubatorrApp, an AI-powered business consultation platform integrating Cohere LLM, OpenAI, FastAPI, and React.js, enabling automated multi-step workflows
- Deployed a staging environment on AWS (Docker, ECR, Elastic Beanstalk, RDS) with auto-scaling and fault tolerance, and launched a production landing page to onboard early users
- Implemented asynchronous task processing with Celery + Redis, reducing backend response latency by 75% in load testing and ensuring fault tolerance with retries and error recovery
- Developed responsive React.js dashboard with real-time AI chat and multi-step forms, improving usability and driving a 60% increase in engagement during UX testing sessions
- Designed secure authentication system (bcrypt hashing, session management, Google OAuth, email verification), reducing account-related errors by 40% during QA testing
- Integrated LangChain-powered conversation memory, enabling contextual AI across multi-phase workflows and reducing repetitive user inputs by 80% in prototype evaluations

Projects

Personal Website Portfolio

- Developed a responsive personal portfolio website using Next.js and Tailwind CSS
- Designed responsive layouts with Tailwind's utility-first approach, optimizing for both desktop and mobile platforms
- Utilized dynamic routing with Next.js for smooth navigation between sections

CryptoLens

- Developed a dynamic cryptocurrency marketplace web application using **React.js and CSS**, featuring real-time data fetching using the CoinGecko API, enabling users to view and search for cryptocurrency details, historical prices, and market trends
- Implemented live search, state management, and multi-page routing for seamless user interaction and currency customization
- Developed interactive data visualizations with Google Charts to showcase historical price trends, optimizing insights for users
- Enhanced performance and reliability with efficient API integration, error handling, and reusable React components for scalability

Automated Python Email Sender

- Developed an automated email sender using smtplib for non-profit Coding Pals, securely connecting to Gmail's server and reducing manual email handling by 80%
- Integrated CSV-based data for dynamic email content, enabling personalized communication across 500+ recipients per campaign, improving open rates by 25%
- Reconnected with 300+ past participants, contributing to a 20% boost in class registrations post-pandemic and improving community outreach efficiency by 40%

UW Robotics Design Team

Waterloo, Ontario

Software Team

September 2024 - April 2025

- Gained hands-on exposure to ROS2 for building modular robotics applications, including node communication and real-time data handling
- Contributed to testing and debugging ROS2 packages, supporting sensor integration and control system validation

EDUCATION

University of Waterloo

Software Engineering, Bachelor of Software Engineering

September 2024 - April 2029
