

TECHNICAL SKILLS

Programming Languages/Frameworks/Libraries/Design Software

- Languages/Frameworks: Python, SQL, C++, Javascript, Typescript, Next.js, React.js, HTML, Tailwind CSS, FastAPI, LangChain, Node.js, Swift, Kotlin, Prisma, Zustand
- Cloud/Infrastructure: AWS (RDS, Elastic Beanstalk, ECR), Docker, Cloudflare, Celery, Redis, Supabase
- Other: Git (GitLab/GitHub), Framer Motion, PostgreSQL, RESTful APIs, Gtest, Linux/Unix OS, TestRail, ADB, VEO

EXPERIENCE

Ford Motor Company

Waterloo, ON

Software Engineer - Product Development

January 2026 - April 2026

- Built Python automation to eliminate manual pre-setup for security test suites, automating Wi-Fi configuration, user profile creation, and Google Play sign-in via ADB UI inspection, reducing setup time to zero
- Designed and authored 8+ manual test cases for the VHAL Simulator callback feature, covering TX signal registration, real-time callback verification, and signal unregistration across 8 supported climate control signals
- Developed cross-platform automated sanity tests and TestRail documentation for Ford's Key Management Trusted Application (Android & QNX), covering key encryption, decryption, and lifecycle management
- Built two reusable helper functions for asserting Suspend-to-RAM state transitions using SSH timeout behaviour as a proxy for device sleep, making the verification repeatable across test benches
- Executed and validated automated test suites for the VHAL Simulator tool across multiple release versions using the Slash framework

TranQuility Inc.

Toronto, ON

Software Engineer — Full Stack Development

May 2025 - August 2025

- Built Encubatorr from an empty repo to a staged production environment, owning the full stack across backend, frontend, database, and deployment
- Designed and deployed a staging environment on AWS using Docker, Elastic Beanstalk, and RDS, enabling the team to confidently move toward a first production release
- Integrated LangChain conversation memory to give the AI consultation engine cross-session context, eliminating repetitive inputs and directly improving early user satisfaction
- Added Celery and Redis to handle concurrent requests without the platform falling over under load
- Designed a secure auth system with bcrypt hashing, session management, Google OAuth, and email verification, handling security end-to-end without third-party auth providers

Projects

Automated Python Email Sender

- Built an automated email system for non-profit Coding Pals using smtplib and CSV-driven templates, reducing manual email handling by 80% and enabling personalized communication to 500+ recipients per campaign
- Reengaged 300+ past participants post-pandemic, contributing to a 20% increase in class registrations and measurably improving community outreach efficiency

Stitch

Hackathon, 36 hours

- Built an AI-powered video editor using Next.js, TypeScript, and PostgreSQL, integrating six AI services including Twelve Labs, ElevenLabs, and VEO
- Designed Lilo Agent, an LLM that reasons over live timeline state and executes edits directly instead of suggesting them
- Generated context-aware video transitions using VEO by extracting boundary frames between clips and inserting the output automatically into the timeline

EDUCATION

University of Waterloo

Software Engineering, Bachelor of Software Engineering

September 2024 - April 2029
